# Formation Mobile Hybride Day 2

# Agenda

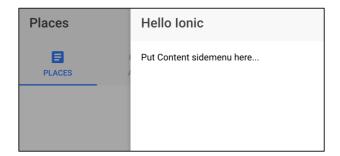

1.	Correction travaux pratiques
2.	Ionic Modal
3.	Authentification JWT
4.	List / Toggle / Select
5.	\$http et promesses

2) Mettre en place un composant header

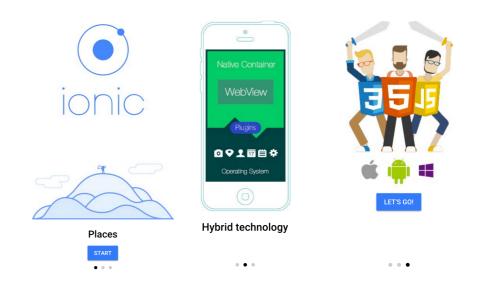

+ Mettre en place un sidemenu

3) Mettre en place un slider sur la home »

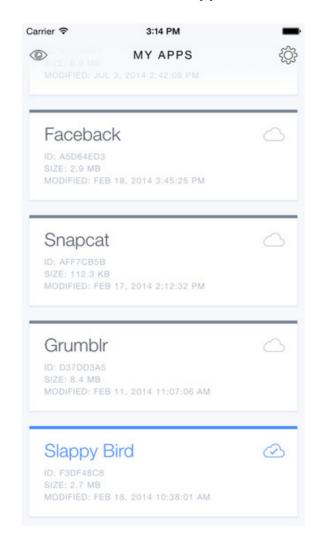

4) Mettre en place une page login

# Testons sur nos téléphones

#### **Ionic View App**

#### **Ionic Modal**

#### **Modal Component**

#### Ouvrir une modal

```
import { ModalController, NavParams } from 'ionic-angular';

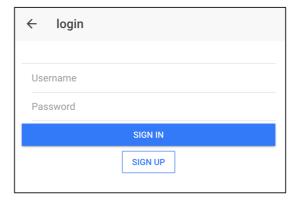

@Component(...)
class HomePage {

constructor(public modalCtrl: ModalController) {

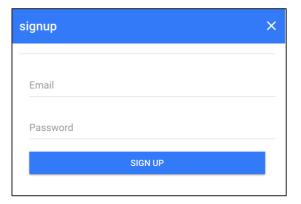

}

presentProfileModal() {
 let profileModal = this.modalCtrl.create(Profile, { userId: 8675309 });
 profileModal.present();
}
```

5) Ajouter un bouton « signup » sur le login

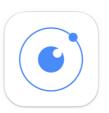

Ouverture de la page en Modal

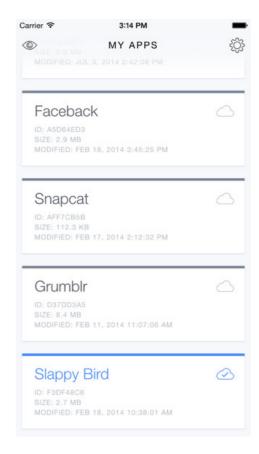

Redirection sur la Home au clique sur Logout

# Testons sur nos téléphones

**Ionic View App** 

\$ ionic upload

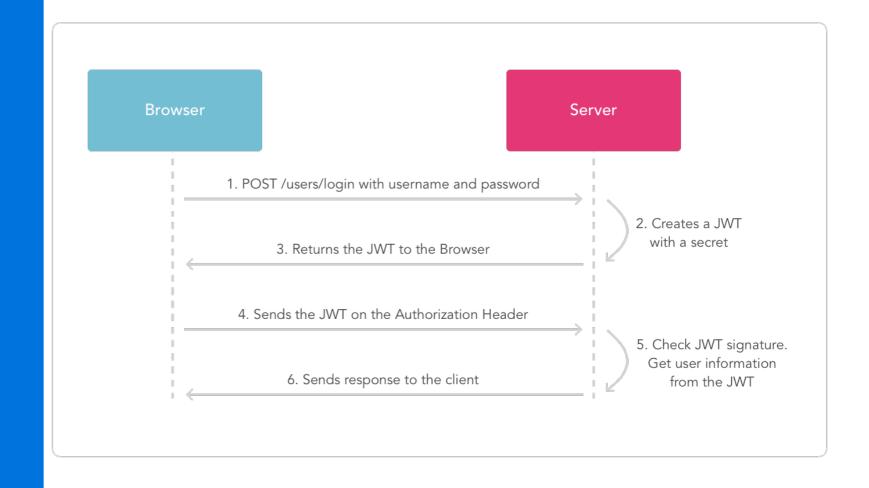

\$ ionic share email@client.io

# Authentification avec JWT (Json Web Token)

#### Json Web Token

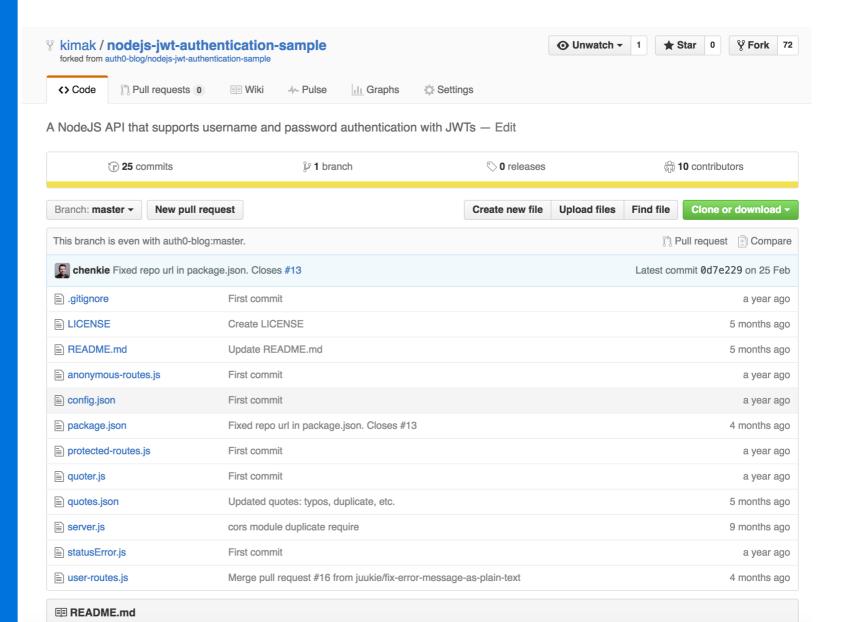

JWT.io

JSON Web Tokens are an open, industry standard RFC 7519 method for representing claims securely between two parties.

#### **Example**

### nodejs-jwt-authentication-sample <a href="https://github.com/kimak/nodejs-jwt-authentication-sample">https://github.com/kimak/nodejs-jwt-authentication-sample</a>

#### Installer angular2-jwt

\$ npm install angular2-jwt --save

#### Configuation for Ionic 2

To configure angular2-jwt in Ionic 2 applications, use the factory pattern in your @NgModule . Since Ionic 2 provides its own API for accessing local storage, configure the tokenGetter to use it.

```
import { AuthHttp, AuthConfig } from 'angular2-jwt';
import { Http } from '@angular/http';
import { Storage } from '@ionic/storage';
let storage = new Storage();
export function getAuthHttp(http) {
  return new AuthHttp(new AuthConfig({
    headerPrefix: YOUR_HEADER_PREFIX,
    noJwtError: true,
   globalHeaders: [{'Accept': 'application/json'}],
    tokenGetter: (() => storage.get('id_token')),
 }), http);
@NgModule({
 imports: [
   IonicModule.forRoot(MyApp),
 ],
  providers: [
     provide: AuthHttp,
     useFactory: getAuthHttp,
     deps: [Http]
   },
  ...
  bootstrap: [IonicApp],
 ...
})
```

Créer un nouveau provider « Endpoints »

\$ ionic g provider endpoints

http://ionic-places-jwt.herokuapp.com

```
import { Injectable } from '@angular/core';

@Injectable()
export class Endpoints {

API_PATH: string = "http://ionic-places-jwt.herokuapp.com"

getLogin(){
   return this.API_PATH + "/sessions/create"
  }

getSignup(){
   return this.API_PATH + "/users"
  }
}
```

Créer un nouveau provider « Auth »

\$ ionic g provider auth

```
@Injectable()
export class Auth {
 contentHeader: Headers = new Headers({"Content-Type": "application/json"});
 jwtHelper: JwtHelper = new JwtHelper();
 local: Storage = new Storage();
 user: string;
 error: string;
 constructor(private authHttp: AuthHttp, private endpoints: Endpoints) {
 signup(credentials) {
   let observable = this.authHttp.post(this.endpoints.getSignup(),
     JSON.stringify(credentials),{ headers: this.contentHeader })
      .map(res => { return res.json()})
        return observable.toPromise().then((data)=>{
          this.authSuccess(data.id_token);
          return data;
       });
 authSuccess(id_token) {
   this.local.set('id_token', id_token);
```

Créer un nouveau provider « Auth »

\$ ionic g provider auth

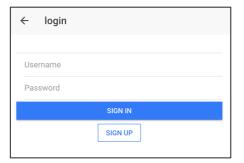

```
@Injectable()
export class Auth {
  contentHeader: Headers = new Headers({"Content-Type": "application/json"});
 jwtHelper: JwtHelper = new JwtHelper();
  local: Storage = new Storage();
  user: string;
  error: string;
 constructor(private authHttp: AuthHttp, private endpoints: Endpoints) {
    this.local.get('id_token').then(token => {
      this.setUser(token);
   }).catch(error => {
      console.log(error);
   });
 signup(credentials) {
   let observable = this.authHttp.post(this.endpoints.getSignup(),
     JSON.stringify(credentials),{ headers: this.contentHeader })
      .map(res => { return res.json()})
        return observable.toPromise().then((data)=>{
         this.authSuccess(data.id_token);
         return data;
       });
 authSuccess(id_token) {
    this.local.set('id_token', id_token);
    this.setUser(id_token);
  setUser(token){
   this.user = this.jwtHelper.decodeToken(token);
```

#### step5

Mise en place du signup

#### Mise en place du signIn

this.authHttp.post(this.endpoints.getLogin()

#### Affichage email + Logout
